

This is a ring with an attached QR code to be able to use as something that can be discrete in showing some software or website. With the rise of VR and AR capabilities with sensors, I wanted to be able to imagine some kind of futuristic design accessory that would be able to show the QR code pad, which could be then used as a sensor to show 3D models that would co respond with a smartphone. This was created using the Mutoh 3D fabrication device and the 123d Design software, and proved to be a fun project because It was one of the first fabrication projects that I have built from scratch. What could be improved upon this, is the usage of powder 3D fabrication machines, that are not in the media lab, but rather in the モノ作り工房.
